

SWIFT SHIP TRACKER

1.INTRODUCTION

Project Overview:

SwiftShip Tracker is a Salesforce-based parcel management and tracking solution. The system organizes parcel, sender, receiver and delivery information, supports automation through Salesforce Flow, and uses AgentForce AI with Prompt Builder for conversational parcel tracking and delivery-related assistance.

Purpose:

- To manage parcel details in one place.
- To make parcel tracking easier.
- To reduce manual work using Salesforce Flows.
- To provide AI-based tracking support using Agentforce.
- To give timely parcel and delivery updates.

2.IDEATION PHASE

2.1 Problem Statement

- Parcel booking and delivery tracking involve different types of information such as parcel details, sender details, receiver details, delivery status, current location, and estimated delivery date.
- Customers need a simple way to book parcels and check the status of their shipments. They may also need regular updates about the movement and delivery of their parcels.
- The main aim is to make parcel management more organized, reduce manual effort, improve tracking visibility, and provide customers with easier access to their shipment information.

2.2 Empathy Map Canvas

Think & Feel:

Wants the parcel booking and tracking process to be simple and convenient. Expects clear information about the shipment.

Hear:

Receives information about parcel booking, delivery status, and estimated delivery from the service provider.

See:

Sees parcel details, delivery status, tracking information, and expected delivery date.

Say & Do:

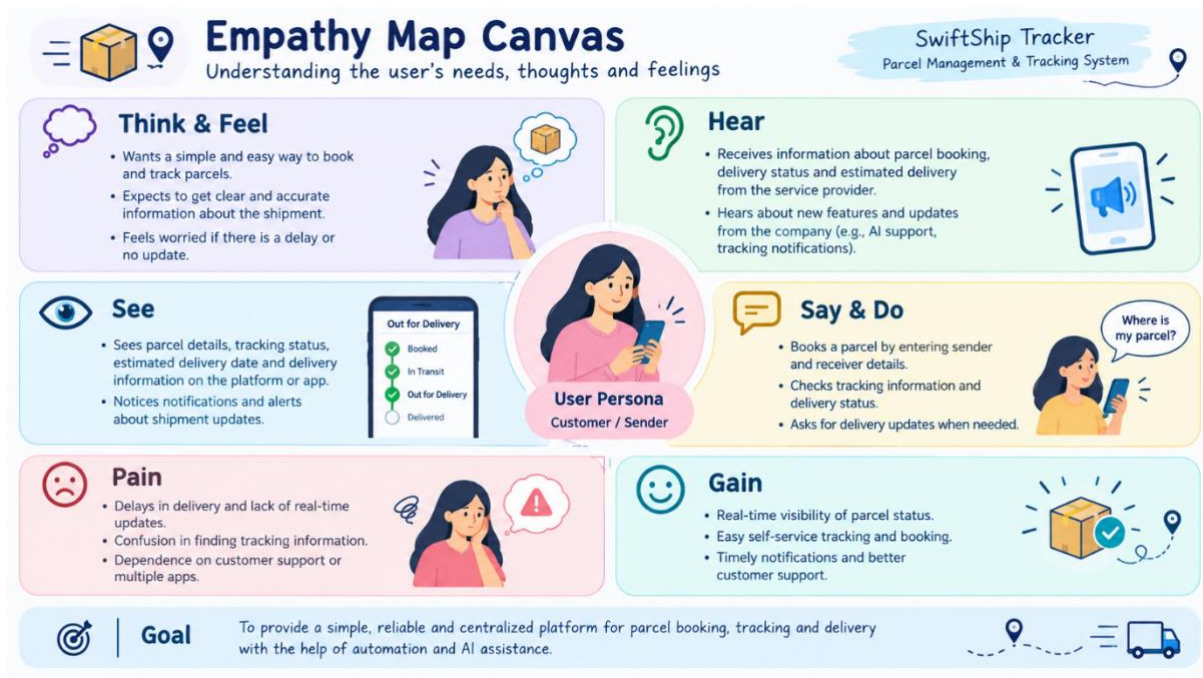

Books a parcel, enters sender and receiver details, checks the shipment status, and looks for delivery updates.

Pain:

May feel confused when tracking information is difficult to find or when updates are not available quickly.

Gain:

Gets easy access to parcel information, better tracking visibility, and timely updates.

2.3 Brainstorming & Idea Prioritization

Different ideas were considered during the brainstorming stage to identify a suitable solution for parcel booking and tracking. The main ideas included maintaining parcel details using manual registers, using spreadsheets, developing a separate parcel tracking portal, and creating a Salesforce-based parcel management system.

Ideas Considered

- Manual registers for recording parcel and delivery details.
- Spreadsheet-based tracking for storing shipment information.
- Standalone parcel tracking portal for customer access.
- Salesforce CRM with AgentForce AI for centralized parcel management and tracking.

Each idea was considered based on factors such as ease of managing parcel information, tracking support, automation, security, customer access, and the ability to handle future requirements.

Thus, the selected idea combines **centralized data management, automation, AI assistance, secure access, tracking visibility, and reporting** in a single Salesforce-based system.
