

3. REQUIREMENT ANALYSIS PHASE

3.1 Customer Journey Map

The customer journey describes the different steps followed by a customer while using the parcel management system.

1. Parcel Booking

The customer enters the required sender and receiver details and provides the parcel information. The booking details are recorded in the system.

2. Booking Confirmation

After the parcel is registered, the customer receives the required booking information and can view the parcel details.

3. Shipment Tracking

The customer checks the current status of the parcel through the tracking system. The shipment status can be updated as the parcel moves through the delivery process.

4. Delivery Updates

The customer can receive information about the progress of the shipment and its delivery status.

5. Parcel Delivery

Once the parcel reaches the destination, the delivery status is updated in the system. The customer can view the final delivery information.

3.2 Solution Requirements

The system requirements were identified based on the needs of customers, delivery agents, and administrators.

Functional Requirements

- The system should allow customers to book and manage parcels.
- It should store sender and receiver details.
- It should maintain parcel and delivery information in a centralized system.
- Customers should be able to check parcel tracking status.
- Delivery agents should be able to update delivery status.
- Salesforce Flows should automate important parcel-related processes.
- AgentForce AI should provide parcel-related assistance and information.

- Reports and dashboards should help administrators monitor parcel operations.

Non-Functional Requirements

- The system should provide secure access to parcel information.
- The application should be easy for users to understand and operate.
- Parcel information should be stored in an organized manner.
- The system should provide reliable access to shipment information.
- User permissions should be controlled according to their roles.

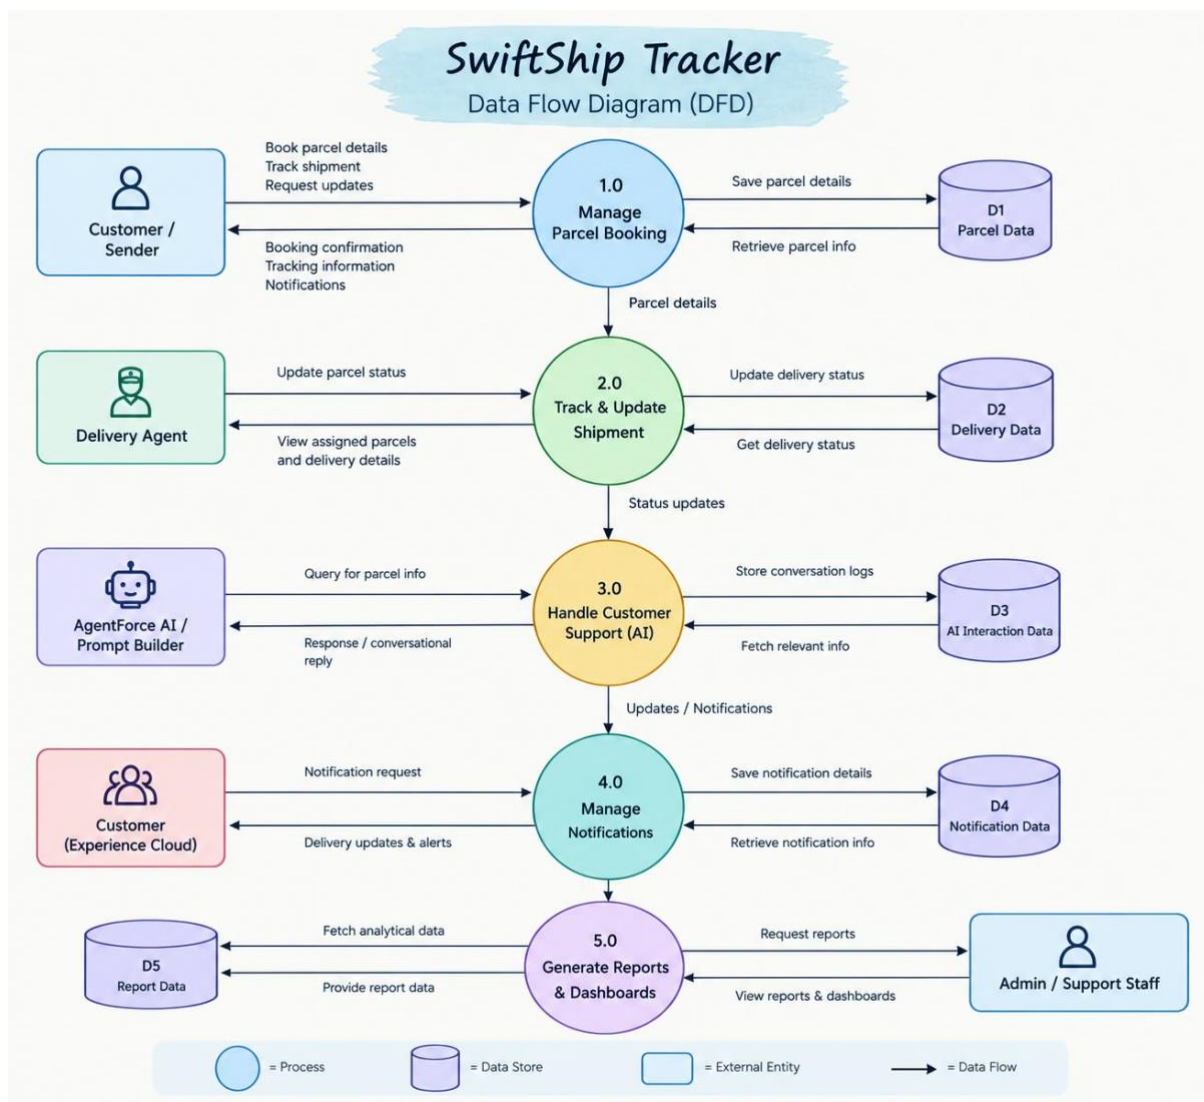

3.3 Data Flow Diagram

- The Data Flow Diagram represents how information moves through the SwiftShip Tracker system.
- The customer provides parcel, sender, and receiver details to the system. These details are stored in Salesforce through the corresponding objects. The delivery agent can update the parcel and delivery status when the shipment progresses.
- The updated information is made available for tracking and monitoring. Salesforce Flows help process required activities automatically. AgentForce can use the available parcel information to provide responses to customer queries.

Main Data Flow:

Customer → Parcel Booking → Salesforce Data → Delivery Update
→ Tracking Information → Customer

This flow helps maintain parcel information in a centralized system and makes tracking easier.

3.4 Technology Stack

The SwiftShip Tracker project uses Salesforce technologies to build and manage the parcel tracking system.

Technology / Tool	Purpose
Salesforce	Main platform for developing the parcel management system
Custom Objects	Store parcel, sender, receiver and delivery information
Salesforce Flows	Automate parcel and delivery-related processes
AgentForce AI	Provides AI-based parcel assistance
Prompt Builder	Supports AI prompts and parcel-related responses
Experience Cloud	Supports user-facing access to the system
Reports & Dashboards	Helps monitor and present operational information
